AMENDMENTS TO THE SPECIFICATION

Please amend the paragraph beginning at Page 6, line 27, of the present application, as follows:

It is contemplated by the present invention that the pump 58 may be controlled to pump the liquid continuously through the bladder 74 at a relatively constant pressure head. FIGURE 2 depicts the therapeutic pad system 50 of FIGURE 1, applied to a limb 30 of a user, and showing a steady-state, or time- and transversely-averaged pressure profile 32 along the length of the pad 70, wherein the highest pressure, P_H, is at the inlet port 76, and the lowest pressure, P_L, is at the outlet port 78. The details of the pressure profile 32 may vary based on a number of factors but will, in general, monotonically decrease along the length of the pad 70, along the direction of the fluid flow. The pad 70 therefore produces a desired pressure profile 32 that is applied to the user along the length of the pad 70, wherein the. The pressure is greater at the distal end, and less at the proximal end, thereby providing a compressive force to the user that encourages a generally proximal lymph flow.
